WISE TALK

HARSHAVARTHAN, FINAL CSE
Advisor & Website Developer

iBevy

Globalisation and the enormous growth in technology has made different foods from different countries available almost in every nook and corner. There are variety of foods that tempts and invites everyone to taste them. The increasing number of middle class families, the easy availability of food around the corner round the clock, is definitely a boon but not the increasing number of people queing up in the hospitals because of the same foods that they eat. Nature provides food according to the climatic conditions and environment of a particular region. The world has become so fast that hybrid foods and genetically modified foods have started to take the place of the traditional food. This will affect the environment over a period of time because the soil and the other eco-system such as the insects that rely on the traditional crops and animals that get fed, might go without food as the taste of the genetically modified crops is very much different and the insects and animals will have a hostile environment.

Multi-national companies that grow these genetically modified and hybrid foods alone will benefit and not the farmers who still rely on the traditional farming. Foriegn companies have taken almost all our seeds and patented them. They have started selling them back to us while we were checking out the foriegn clothes, entertainments and the foods that won't suit our physical structure. The result is so obivious that we have started ignoring our traditional foods and thus our farmers. This has forced our farmers to abandon farming and sell their lands for whichever price the multi-national companies fix with the help of our rulers.

“YOU ARE WHAT YOU EAT; SO DON'T EAT FAST, CHEAP, EASY OR FAKE”

It's very confusing for the general public about which foods are good and which are bad because each media gives their own versions about what is good and what is bad. There is no such thing as diet because eating healthy food itself is diet and that's why our forefathers have told that food is medicine. If we choose healthy and organic food to eat, we will stay healthy and there would be no need for a diet chart. At times we tend to go for cheap food, at times food that could be consumed quickly, at times food that could be cooked quickly and most of the time the fake genetically modified and hybrid foods. Let's choose wisely so that we won't regret our choice later.

Editorial

ARE WE EATING REAL FOOD?

We eat a lot and we like to dine outside. We have learnt to eat anything that's new and that which doesn't belong to our traditional food chart. This increasing need for food variety has ended-up with hybrid and genetically modified foods. Hybrid foods are created by altering the natural order of the crop. Although hybrid and genetically modified foods help in meeting the ever-growing global food demand, the downside is that they are not as good as non-hybrid and organic foods.

HYBRID FOODS

Hybrid fruits and plants were first produced commercially in the mid-1930s and created by crossbreeding two different specimens of the same plant. Hybrid foods are not natural because the crossbreeding is made by man to achieve specific purposes such as, to increase the food production, obtain certain desired characters like colour, size, and shape or to increase the concentration of certain nutrients.

The main feature of hybrid foods is that their seeds cannot incubate on their own. They require human intervention to grow. Crossbreeding two different specimens of a particular plant to produce a superior version of the plant is not something new. It was practiced in the ancient world too, but not at this big scale as it is practised today.

History of hybrid foods

According to Dr.J.E.Williams, the purpose of hybrid foods, when they were produced for the first time, was to help farmers produce crops on farms on which natural foods could not grow. During the 19th century, and in the first few decades of the 20th century this method was known as mono-cropping.

ARE WE EATING REAL FOOD?

Every farmer, big or small started producing atleast one hybrid crop a year. The result of years of mono-cropping, although inescapable when you look back, was devastating. Aggressive mono-cropping, coupled with heavy, incessant use of pesticides and herbicides lead to large scale plant disease and made the soil unconducive. So farmers, scientists and governments agreed to produce hybrid foods to overcome this issue.

Health experts' view on hybrid foods

The most ardent opponents of hybrid foods would not hesitate in branding hybrid foods outrightly as unhealthy. However, most naturalists do not go that far and stay away from proclaiming hybrid foods are dangerous. Hybrid foods, till date, have also not been known to cause any diseases.

Hybrid foods are not dangerous, but they are not as healthy as natural foods and they could not provide the same benefits as natural foods. That is why, so many concerns are being raised over the unchecked marketing and distribution of hybrid foods. Hybrid foods are not as healthy as natural foods, because,

- They have high sugar and starch content. Sugar present in hybrid foods is not completely absorbed by the pancreas and liver.
- They don't have proper mineral balance. Consumption of hybrid foods, over time, may lead to mineral imbalance.
- Some hybrid foods can worsen certain fungal conditions like Candida.

Genetically modified (GM) foods make the situation worse

Genetically modified foods are obtained from genetically-modified organisms. Some proclaim that genetically modified foods can put an end to the world hunger issue, while others regard them as dangerous to both mankind and the environment.

The biggest risk of GM foods is that the risk of allergenicity. It is possible that genetic modification may create new allergens, which can cause allergies in humans or worsen existing allergies. The danger of GM foods to the environment is not small as claimed by the environmentalists that GM foods can disturb the food chain.

Hybrid and genetically modified foods vs organic foods

Hybrid and genetically modified foods help only their producers and not the consumers. In such a scenario, consumers cannot do anything about it. **The best solution is to avoid these and consume organic foods as much as possible. Growing your own food is another great way to ensure that you have nutritional foods.**

Natural foods which are also called organic foods are not tampered with and are grown in their natural form and environment. Moreover, harmful pesticides and other chemicals are not used in organic farms. In other words, organic foods do not contain chemical treatments. Their only drawback is that they cost a little more than hybrid and GM foods. **However, health experts argue spending a little more on healthy organic foods especially when you can, is a good bargain. As they say, your health is in your hands and make wise choices regarding what you buy in order to stay healthy. Remember, there is always a duplicate product that looks exactly as the original, so be cautious.**

III MECH-TVS

LAY OFF'17 - PART II

As I had mentioned in my previous article, layoffs in the IT Industry has put everyone into greater fear of Job Security. As days go by, more MNC companies are laying off their employees and they claim that the reason behind the layoff is cost control measures. The other reason could be the automation in the IT sector which I had described in the previous article. The companies and organizations increasingly go for automation and new-age technologies such as Big Data, Artificial Intelligence, Machine Learning, Data Mining, Virtual Reality and Deep Learning. Jobs are getting drastically slashed because the employees are expected to update themselves with these emerging platforms. The phenomenon has already started showing its effects with regular job cuts across the Information Technology sector as Layoff, which could seriously impact India's economy and growth.

Most of the IT companies abroad used to import talent from India to complete their projects with less investment on the salary part. The restriction to H1B visa has also caused a major impact in the Layoff game. As major countries like USA, Singapore and New Zealand have stopped issuing Visa to Indian professionals, people who have worked in these countries will find a secure job in the Indian IT sector that look for experienced employees with working skills on the latest technologies because companies could save the investment for training the fresh candidates. Many IT companies in India spend crores of rupees to train freshers who directly join from colleges and other reputed institutions. Infosys has also said that it will hire 10,000 Americans in the coming two years as well as open up four centers in the USA. With this news, the IT major is perhaps prepping the ground for mass layoffs in India. The worst part of this is that the companies have not yet released exact count of layoff and they claim that the count may go up in the future. Sometimes, highly performing employees are too fired from the job which might have happened because of various other reasons.

One reason that I would like to discuss here is that when a company decides to layoff, it is removing an entire department, so even the highly performing employees will also be fired. However, if a company is cutting down on certain parts from every section, the employer has tough decisions to make. Some might be confused between termination and layoff. So here I would like to refer explanation given by a senior Content Writer Anamika Bhattacharjee from Speridian Technologies.

"Never ever confuse a layoff with termination. Termination happens to an employee if he/she is incapable of either performing well or has disciplinary issues, or some serious health issue. And layoff is a mass scale (or even small scale), asking the employees to leave when the company is cutting down on costs or when it is not able to run successfully.

While termination is primarily the employees' fault, layoff could happen out of anything from the company's failure, slow industry growth or even when the entire market economy is in serious doldrums." Layoff will continue till the companies are satisfied with their employees' working progress and how they are updating themselves to recent technologies which will make them move along with the companies that migrate to the latest technologies. I like to add another point to escape layoff which I had mentioned in my previous article. Try to become an Entrepreneur where you can provide job opportunities to atleast 10 people. If the count of entrepreneurs in India goes up, it would directly help reduce the unemployment count.

HARSHAVARTHAN

FINAL CSE

BE WHO YOU ARE

Every time when we make a decision as adults, we bury a part of ourselves deep down, denying who we are and this is a serious issue. The opportunities for adults to deny their true self in favour of approvals end-up in a disaster and choices can be felt complicated. Sometimes we end up compromising who we are because it is hard to say NO. Being true to yourself starts with knowing who you are and accepting yourself, knowing your strengths, passion, limitations and purpose in life and then living that way all the time.

Being true to yourself is a personal choice for truth and making choices about how you want to live. It means you don't need to worry about pleasing other people or living by someone else's standards or rules. No one except you can tell you how you could be true to yourself. Start examining your life in your mind and heart to see if every single situation you are involved with is healthy for you.

Always execute your plans in a way that satisfies you completely. When you have to satisfy others' needs, you always have to do it in a way that your soul too enjoys the act. When we're caught up into thinking about who we want to become, our ego takes over and we stop working. We begin to place more importance on things that don't matter such as our position in society and how other people would view us if we do this rather than on what we could accomplish, that's a real shame.

It's OKAY to be YOU

A black and white photograph of a person with a backpack walking away from the camera on a dirt path in a desert landscape. The word 'YOU' is overlaid in large, colorful letters (blue 'Y', yellow 'O', red 'U') across the middle of the image.

You are what you do. When you're not doing it, you're not that thing! You don't earn a title because of what you've done in the past, and you certainly don't earn a title because it's what you and your ego want to be. Instead of worrying about being successful in the future, start making small things successful today. Just be aware what you are doing and how you are executing it without hurting others and that is success. Aligning yourself with your purpose and dedicating yourself in executing it without worrying about the results, will bring peace and satisfaction at the end.

What's the secret to become exactly who you want to be? Stop focusing on becoming because it's a wrong objective. The whole "being" thing will work itself out if you focus on the task at hand. If it doesn't, at least you'll spend your days fulfilled knowing that your time on this planet was spent accomplishing something that mattered. A lot of people spend most of their life trying to fit in or to be someone who they are not.

Don't fall into this category, ever! It's great to emulate someone who is of a positive role model but you can only aspire to be yourself at the end. Be yourself and be true to yourself and only that matters. If you're living someone else's life, who are you? I used to be the square peg jamming myself in the round hole for many years. I used to be the odd one in the crowd. It's strange how things work out later on. Don't live in the shadows. Let your light shine and be proud of who you are. Trust me you are worth it!

Your only obligation in any lifetime is to be true to yourself.

-Richard Bach

VeryBestQuotes.com
photo: Joseph Hart

We all carry a picture of ourselves in our minds. A picture of what we believe we are like. A picture that we choose to believe no matter what. We can cling to this idea about ourselves, but that might not be true. This is not easy to realise and even harder to accept, but it's an important step towards a conscious life. I believe we all go through dark phases and when our image of ourselves breaks, we start thinking of ourselves as inferior or worthless. So it's better to carry a better self-image full of positive energy that would be stable even after many downfalls.

The good news is that you are whoever you choose to be. No matter what situation life presents us, we can always choose to view ourselves the way we want. You can either view yourself as a victim or a hero who lived through all the controversies because it's all a matter of perspective. Whichever image you choose to be or become you will start behaving that way. This has nothing to do with the person you actually are; it solely depends on how you choose to view yourself.

PASSION VS PROFESSION

One of the most difficult task for the youngsters today is completing B.E degree without their interest but for the sake of their parents. Because engineering has a very good scope across the globe, parents have forced their children to pursue engineering and they had to give up their real passion for the sake of becoming an engineer. It's one's passion that would lead and make that person as a complete human being. I'm one such person who was directed to engineering although my passion is to write stories. I was wondering and worrying at the same time how to synchronize engineering and story writing. Here I go with my idea, writing engineering stories as an electrical engineer.

Love between a Resistor and a Diode

My fantasy world of electronics and elctricals is ruled by the gods of current and voltage. This world consists of one country, one state one district and one village named Electronica. There lived many people named transistors, LEDs, wires etc. Here comes my hero named Resistor with the attitude of an atheist (property of resistor is to resist the current (or) voltage). Then my heroine named diode comes with the attitude of adamant (property says it starts conduction after 0.7V with the adamant nature). A first love erupts in electronica and it emerges with the help of an oscillator(new building in that place). All the peoples were invited for the opening ceremony of the building . So our hero and heroine went to the ceremony. Resistor met transistor and they became friends. During the lunch, transistor and diode had a misunderstanding and diode left the ceremony in the middle.

PASSION VS PROFESSION

Resistor couldn't resist and kept thinking about diode the whole night. After few days, diode met resistor outside an amplifier (temple in that place). Diode and Resistor regreted their behaviour during the ceremony. This time, diode started to think about resistor the whole time. Few days later, both had an interaction at a wire palace (hospital in that place, for repairmen of lead in their parts). They learnt about each other better and started feeling for one another. Days went on and their friendship improved and became more intense but their attitude didn't suit each other. They both ended up in a problem that they couldn't solve.

There came our transistor to solve it. The transistor (doctor) knew about their problem and he tried to solve it but it ended up in failure. They can't change their nature for each other. The transistor analysed and found out that some bug had bitten them. They also analysed themselves and found out that something was happening to them which they couldn't express. Transistor got them married by making them attached to each other, yes, the resistor and diode make the best pair in PCB (marriage, permanent fixing).

Although the moral of the story is to ignore one's ego and show consideration to others, I was happy at the end that I was able to link my passion to my profession to simplify my understanding about my learning. Fight for your passion if you could or apply your passion on whatever you learn.

“CAN SOCIAL NETWORKS REPLACE FACE TO FACE COMMUNICATION”

I write this to make others aware of the changes that social networking sites have brought. The points for this write-up were collected from a group discussion conducted as part of the LSRW programme. In ancient days, people enjoyed visiting their neighbours' houses and share things.

Now a days, people simply sit at home fiddling with their mobiles or watching television. This distances everyone in their own house because no one likes to talk. Young people are addicted to technology that spoils their health and builds stress from a very small age. They often look confused and like to hide things from their parents. They also get into the social media like facebook and get trapped in problems brought by strangers.

Face-to-face interaction is concerned with few issues such as its organised rules and strategy. Face-to-face communication could easily be interrupted or avoided by just using a mobile phone or other electronic devices where people need not worry about the non-verbal communication, the tone or even controversies that would arise. So people use technology as a tool to escape.

Even though we possess the cutting edge technology to communicate in space and time for years now, majority of the world's population lack in human communication skills. People don't want to talk to the other person as they live in a virtual world where no one speaks, so they don't need to listen.

“WILL SOCIAL NETWORKS REPLACE FACE TO FACE COMMUNICATION”

Despite the advent of many new information and communication technologies, face-to-face interaction is still widespread and popular. Nadi and whittakar (2002) noted that “MANY THEORISTS IMPLY THAT FACE-TO-FACE COMMUNICATION IS THE GOLD STANDARD OF COMMUNICATION”, particularly in the context of the media richness theory where face-to-face communication is described as the most efficient and informational one.

“THE BEST AND MOST BEAUTIFUL THINGS IN THE WORLD CANNOT COME FROM SOCIAL MEDIA THEY MUST BE FELT WITH THE HEART”

Due to technological development, the quotes don't hold much water today. The usage of social networking cites have increased to a great extent. Every coin has two sides likewise, the social media also have their own advantages and limitations. Now-a-days, face to face communication is replaced by social networking because people are busy spending time on different sites and apps rather than communicating face to face with other people.

Social networking helps us communicate with people anywhere in the world at any time. Although social media plays a major role today, it hasn't got the charm of face to face communication, because only in face to face communication people could share their emotions. It also brings more trouble when people, especially girls find themselves in a vulnerable position when their private lives are thrown open by few sadists in the name of friendship.

**“WHERE THERE IS DEVELOPMENT,
THERE WILL BE DISTRACTION OF HUMAN SOCIETY”**

The above quote is 100% true because even when few friends or family members talk, they are not able to maintain eye-contact with the speaker because their eyes are either fixed on their mobile or on the television. They would like to be contacted over phone although they sit near to each other. Social media is breaking relationships. They spoil one's character because everything is done in hidden places. They decrease reading habits, cause mental stress, depression and brings laziness and lethargy as the end products.

**“PRESENT DAY SOCIAL MEDIA COME INTO LIFE AS FACTS BUT
NOW, IT BECOMES THE FATE OF HUMAN BEINGS”.**

Face-to-face communication has been however described as less preferable to mediated communication in some situations, particularly where time and geographical distance are an issue. Kerry (2010) stated that “face-to-face interaction is still seen as the best form of teaching”. In account to the politics, burnell(2011) observes that “face-to-face interaction is a preferred means to active contact and maintain strong ties”. Telephone, email and instant messages play an important role in maintaining long-distance friendship and technology kept improving by bringing face-to-face communication through technologies like skype. Let's use technology to improve our prospects but not for communication when the person is around us. Face-to-Face communication will remain the last thing on the earth if the earth goes extinct because technology can't comfort people and understand human emotions and fears.

**R.VEERASANTHYA
III ECE**

A GROUP!! A TEAM !! NOW A NETWORK!!

On reading this topic what do you think you'll gain guys!!?? Guess what I am going to cover in this article? It's an article on how a small group entered the great silicon valley in the United States of America and now it has become the world's top network!.....Yeah... You are right, if you guessed it is FACEBOOK! Facebook was started in the year 2005 by few dropouts of HARVARD University in the US. A small plan started without even knowing that people will accept the project or not.

The co-founders of facebook are Mark Zuckerberg and Eduardo Saverin along with their roommates. They started to build this great social network in a small scale. At first, they sat together and made a project named FACEMASH, a small application in which the photos of Harvard students were edited to funny pictures and then posted. This led Mark and Eduardo to be punished and suspended from the University for a while due to which they dropped the project. After few months, they created a new project that acted as an alumni network for the students of Harvard, Stanford, Cambridge, Berkeley, Oxford and many other reputed Universities in the United States of America which became a huge hit.

**“SUCCESS IS SIMPLE
DO WHAT’S RIGHT
THE RIGHT WAY
AT THE RIGHT TIME”**

Along the course of time Mark and Eduardo made a Music application like the iTunes by Apple and the application was used by Microsoft through which Mark and Eduardo came into the Real market. Mark had a dream of making a grand project in his lifetime. One night, he and his friends started to work on a project called facebook. Here came the dream to a real state of honour. Initially, they made the project as a small one combining the FACEMASH and the alumini network together. In few years, it had 5 million users and emerged as a new company in the IT market with Mark Zuckerberg as the CEO. After entering into the silicon valley, his friends moved out of FACEBOOK and started new networks like Quora, Zomato and many other stuff. Eduardo also came out of facebook as he thought that he was not respected in the team as a co-founder. Finally, Mark was on his own and moved things with a new team of facebook. Companies, such as Yahoo, Microsoft offered jobs for Mark and asked him to work on the same project under their company.

Dream Big

Set Goals

Take Action!

But, Mark had other ideas and he brought the new space called NEWS FEED in facebook which was first opposed by people and Mark regretted for that action but it was later accepted and appreciated by the same people. Similarly, people started protesting against facebook that it revealed the secrets and personal identities in the social network but Mark assured that privacy settings will be improved and their profiles will be secure. Now facebook is the world's largest social network with more than 12 million users and even companies like google offered 250 million dollars for just 1.6% ownership of the company...

I wish to bring this motivational story to all my fellow students of both IT and CSE departments by iterating that even a small project may become a big one in the future. Everything is useful in life, do not waste time but be addicted to technical projects and do them joyfully. We all can become future techies with flying colours. Wish you guys all the best and thanks for spending your time to read this small article because motivationa can happen from any small thing in life and if my article does that to atleast one person, I'm happy.

SAIRAM
III IT

STRESS THAT A PROCRASTINATOR EXPERIENCES

It's a rainy day and only two days left for my sixth semester final Mini-project review. Yet, I didn't complete anything because I'm a Procrastinator. All my friends had completed all their works. This situation and the weather condition with heavy rain and thunder made me think that it is my "DOOMS DAY" (only for me). Then I reached my Guide with the rough hard copy of my report. Unfortunately, the forthcoming two days were holidays followed by last internal exam. After holidays, I successfully completed my internal exam and went to my Guide to get my corrected hard copy of my report. The entire copy was filled with red marks. I stood alone and I didn't get any help from my batch mates. The only hope for me was my dude Santhosh, my partner in Cadence laboratory after 5 P.M. With his support I changed the entire report. Once I got out of the lab I noticed that the sun didn't want to see my face and he hid himself behind the mountain. The night before my Judgement day, the final review of my Mini-project, I took the fair hard copies of my report. Finally, the day came, I went to my Guide for the purpose of verification and to get blessings. My Guide shocked me by saying that the title in the report was not the exact one of my project. Only then I noticed that how the mistake happened.

levels of procrastination

1. non-procrastinator

2. Sunday-night slacker

3. super slacker

4. master procrastinator

I couldn't control my anxiety and disappointment. People around me started yelling at me badly by saying what I had done to complete the project in the past days. I was totally broken on hearing those words and I felt like they were crushing me beneath a road roller. Without waiting further, I rushed to the photocopy shop after making proper changes in the soft copy of my report. I convinced the shopkeeper to reprint the required pages and rebind the report although they refused at first. Finally, I got the corrected report and I attended the review session of my mini project and completed it successfully.

MORAL: The habit of procrastination will lead one to frustration and it will increase one's stress level. On the other hand doing duties at the right time will make one to forget most of the memorable incidents that happens rarely in our life. I'm not saying that we should postpone to get a memorable moment but for me that frustrated feeling brings a smile in my face every time when I think of that incident. If we do thing right at the right time, we can avoid a whole lot of stressful moments in our life. Happiness lies not in procrastination but in doing what we have to do at present.

M.Vigneshwar
Final EEE

ARE WE HUMANS?

What do people do in their lives? First they step out from a dark place that's their mother's wombs as a human being. Their childhood starts with playfulness and continues with their studies. Their teenage runs out with a book in their hands and this book runs with them beyond teenage and ends in early 20's. Unfortunately, after 18-20 years of education, they end up in a job to earn their daily bread. Then marriage and most people think finally it's going to be the most beautiful part in their life, sadly No! They procreate their next generation and they have to do the same bread earning business for their whole family. When they get old, they wait to die and if they are little healthy they wait in their homes, else they wait in the hospitals.

Let's see a life of an animal for example. Let's consider a dog. It also steps out from a dark place as a new life and plays for sometime and learns to earn its daily bread. I will say it is more smarter than us because it doesn't need that 20 years of education to earn its meals. Since there is no social structure for them, of course marriage is out of option, they don't want to be outnumbered, so they procreate and feed their puppies as we do. As usual, when time comes, it dies.

I see no big difference between Humans and Animals. Our life also starts at one point, we earn food like them, procreate like them and die like them someday. This thing is called survival that's what they do and we the so called humans do the same thing in a better organized way, I call this as Hi-Tech survival and nothing more than that. Just check who is preserving the environment, who is living in the natural way and who is satisfied and happy.

MOTHER NATURE —VS— HUMAN NATURE

Whether you are born in a hut or in a villa doesn't make any big difference because the same thing happened but in different places. If you sleep under a tree or in a palace what's the big difference because it's the same action, but there is a chance of getting bitten by a snake when sleeping under a tree, as there is no such possibility for the one who sleeps in a palace. So I call that as a well organized way of survival but survival is just survival. There is a huge pit, if you make your journey to the pit by foot or by Mercedes the result is going to be same.

Humans make technologies by using science to make their life easier and assume that life is tougher for other creatures. So they think that they are smartest ones on the earth. We Humans are the only creatures who don't nourish ecology and protect the environment because luxuries have become our needs but all the other creatures do that invariably. If all the earthworms die within 2 to 3 years, life will become extinct in this planet and if all the bacteria die within 3 to 4 weeks the earth will become unsuitable to hold any life in it. So there are more life in this planet that are more important than humans. Humans are the only creatures in the whole planet with backbones perpendicular to the surface of the earth and all the other creatures have their backbones parallel to the surface of the earth, so scientists say it's the evolution from animal to human. In evolution process humans stand top of all creatures, but according to nature we are in more destructive mode than in creative mode.

Do humans deserve to stand on top of the evolution chart?
